

QUARTERLY REPORT
ST. CHARLES COUNTY WELL FIELD
MONITORING PROJECT
GRANT NO. DE-FG05-89OR21864

Prepared by: Stanley Remington
April, May and June, 1996

MONTHLY REPORT

APRIL 1996

BY

Stanley M. Remington
Consulting Hydrologist

I. CHEMICAL ANALYSES

The results of the yearly analyses of all the pumping wells and observation wells taken by the Department of Energy have been received. I took only two samples, one from RMW-2 and one from PW-9. These latter results are appended. These samples were taken on March 21, 1996. A slightly elevated reading of 36 +/- was noted for PW-9. However a total uranium count of less than 0.005 was obtained. This would indicate that an error or outside contamination occurred. This is not uncommon for gross beta readings. All of the readings or results were reported in picocuries per liter. No other abnormal results were noted. The yearly samples measure several chemical parameters normally not measured. So the conclusion would be, that **NO DANGER EXISTS FOR IMMEDIATE CONTAMINATION** of the St. Charles County well fields and none is anticipated. RMW-2 is located halfway between the quarry and well number PW-9 and no contamination has yet reached this observation well for the past 50 years since hazardous waste products were dumped into the quarry. In fact no hazardous substances have ever been detected south of the Femme Osage Slough.

The results of the sampling of the treated water from the raffinate pits were received and are appended. All of the results showed that the treatment procedures are

working, since all of the chemicals analyzed for were well below the NPDES limits.

Well number PW-3 was sampled by me on April 26, 1996. I sampled this well because of an abnormally high reading of 130 pCi/l was obtained on September 28, 1995. (See explanation below)

Appended is the Quarterly Site and Quarry Water Treatment Plant Effluent Data Summary - First Quarter 1996. This was received from the Department of Energy.

II. CHEMICAL ANALYSIS OF HIGH GROSS BETA READINGS FOR PW-3

Some high gross beta readings were noted in the Fourth Quarterly Environmental Data Summary of 1995 by the DOE. A letter of explanation was sent to Mr. Joe Nichols who in turn sent it to me for an analysis. The letter is appended. A reading of 130 pCi/l for well number PW-3 (PW03 in the DOE letter) was noted from a sample taken on September 28, 1995. A subsequent sample was taken during December 1995 which showed a reading of only 5.4 pCi/l, the normal range for this well. In analyzing the treatment for the raw water coming in from all of the wells at the treatment plant on the same day, that is September 28,

1995, no abnormal reading of the gross beta was noted. The conclusion is that the sample itself was contaminated for some reason. Since the combination of all the well waters was normal and a subsequent reading of 5.4 pCi/l was noted three months later, and examining the history of the gross beta readings for PW-3, it can be concluded that no contamination of the well itself has occurred. This is also true of the two GW wells mentioned in the letter. As mentioned above, no real contamination has ever been detected south of the Femme Osage Slough. There are some good geological and chemical reasons for this occurrence. I have discussed this in past reports, and the DOE has made the same conclusions. Therefore I am not concerned with the occasional high readings detected by the DOE and me. They have invariably been errors or contaminated sample bottles causing the abnormal readings.

IV. HYDROGRAPHS

Appended are hydrographs of the pumping wells of the St. Charles County well field. As noted a sharp rise in ground water levels occurred last spring and early summer when the well field was flooded. Since then the water table has resumed its normal range.

V. FUTURE PLANS

I will sample well number PW-2 during May 1996 and then well number PW-4 the following month to check on any possible high gross beta readings.

VI. MISCELLANEOUS

Appended is the St. Charles County Monthly Water Sales Report for the month of March 1996.

RE: ATAS #15356.01
Weldon Spring

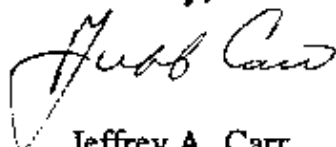

Dear Mr. Remington:

Enclosed is the analytical report for the sample received in our laboratory on April 9, 1996.

If, in your review, you should have any questions or require additional information, please call.

Thank you for choosing ATAS for your analytical needs.

Sincerely,

Jeffrey A. Carr
Project Manager

Joe R. Nichols

County Engineer - Water Dept.

St. Charles County

April 3, 1996

Mr. Stanley Remington
956 Broadmoor Lane
St. Charles, Mo. 63301-6201

RE: St. Charles County Well Field

Dear Stan:

Enclosed please find a letter dated April 1, 1996 with regard to an exceedence for PW03. Please review this letter and offer your opinion regarding this exceedence. Since we were pumping from a number of wells at that time please review the incoming raw water to see if there was an elevated gross beta level which would indicate there was an actual exceedence and not just a false lab test.

I would also like for you to pay particular attention to this well in your future testing procedures just to make sure that an exceedence is not a recurring phenomena.

Please advise me on this matter.

Sincerely,

Joe R. Nichols
County Engineer

April 1, 1996

Mr. Joe Nichols
St. Charles County Engineer
201 N. Second Street
Suite 249
St. Charles, Missouri 63301

Dear Mr. Nichols:

**VERBAL INQUIRY REGARDING DATA PRESENTED IN THE QUARTERLY
ENVIRONMENTAL DATA SUMMARY (QEDS) FOR FOURTH QUARTER 1995**

In response to your recent inquiry regarding GW-PW03-Q395 and GW-RAWW-Q495 data presented in the QEDS, I have presented below the facts surrounding the data anomalies.

In November, 1995 an elevated value of gross beta was recognized in a groundwater sample from the St. Charles County Public Water Supply pumping well PW03, collected on September 28, 1995. The gross beta value for this sample was 130 pCi/l. Normal range for this location gross beta is between 4 and 10 pCi/l. The analysis was validated by the ES&H VVG and re-analysis of the sample was requested. Re-analysis also indicated that the sample exceeded normal range.

A thorough review of historical data for the PW03 location, data for St. Charles County Water Treatment Plant influent (09/28/95 raw water from the pumping wells), and historical and recent data from pumping wells and monitoring wells hydraulically upgradient and crossgradient of the PW03 location was conducted. The following conclusions were drawn from the data review :

1. No radiological parameters or isotopes associated with WSSRAP (uranium, radium, thorium) were elevated above normal range for the 09/28/95 pumping well PW03 sample. If the elevated beta value is valid, it is possible that other naturally occurring beta-emitting isotopes (such as Potassium-40) are contributors.

2. No elevated gross beta or other radiological parameter was elevated above normal range in upgradient or crossgradient pumping wells or monitoring wells. Any WSSRAP-source radiological contaminants of concern would have been detected hydraulically downgradient from the Quarry in the monitoring wells in the vicinity of the Femme Osage Slough, the RMW wells in the well field, and other pumping wells upgradient from PW03.
3. Analytical results of the County Water Treatment Plant influent originating from the pumping wells indicated the gross beta activity and other radiological parameters were within the normal range for 09/28/95.

It was concluded that the elevated gross beta value was most likely artificial. It is possible that contamination of the sample occurred during sample collection or at the analytical laboratory. However, samples collected on the same day before and after the PW03 location did not show any elevated gross beta values. The location was resampled in December, 1995 and the gross beta value was 5.4 pCi/l, within normal range.

Regarding the elevated gross beta for GW-RAWW-Q395, this value is suspected to be a laboratory error because all pumping wells that contribute to the influent were within their normal ranges of between 5 pCi/l to 10 pCi/l. Reanalysis of this sample yielded a gross beta concentration of 5.8 pCi/l.

If there are questions, please call me or Tom Pauling at (314)441-8978.

Sincerely,

**QUARTERLY SITE AND QUARRY WATER TREATMENT PLANT EFFLUENT DATA
SUMMARY - FIRST QUARTER 1996**

Enclosed please find the subject effluent data summary sheets for the batches of water treated and discharged during the first quarter of 1996. Six batches (S#072 through S#077) and two batches (Q#042 through Q#043) have been treated and discharged from the site and quarry water treatment plants, respectively.

If you have any questions, please call me or Bruce Ballew at (314)441-8978.

Sincerely,

MONTHLY REPORT

MAY 1996

BY

Stanley M. Remington
Consulting Hydrologist

I. CHEMICAL ANALYSES

An abnormally high reading of 130 Picocuries was obtained by the Department of Energy on September 28, 1995 from well number PW-3. This was for gross beta particles. The DOE subsequently retested the well in December 1995 and obtained only a gross beta reading of 5.4 pCi/l (picocuries per liter). This shows that the 130 pCi/l was in error since the high reading obtained had never occurred before. Consequently I sampled well number PW-3 on April 26, 1996. A reading of 8 +/- pCi/l of gross beta was obtained showing that the gross beta content from this well is well within the NPDES guidelines. The results are appended. During May I sampled wells PW-2 and PW-9 to determine gross alpha, gross beta and nitroaromatics. The results have not yet been received. I also took a sample from the treated water at the chemical plant site for analyses. These results have also not been received.

II. DOE QUARTERLY REPORT - FIRST QUARTER 1996

Appended are the first six pages of the DOE's quarterly environmental data summary for the first quarterly 1996. Significant data, defined as data values that have exceeded defined "above normal" values, are discussed in the report.

Eighteen samples are discussed as exceeding normal ranges. Most of the samples are from wells and one is from a spring.

Two samples from the St. Charles County well field showed a high reading of arsenic from observation well RMW-2. A data validation has been requested, that is another sample will be taken from the RMW-2 observation well, to recheck for arsenic. One sample showed a significantly high gross beta value from the influent raw water coming into the treatment plant. A subsequent sample from the same source showed a reading of only 5.8 pCi/l which is in the normal range for gross beta at this location. No abnormal readings have been noted from any pumping wells in the St. Charles County Well Field during May 1996.

III. FUTURE PLANS

Because of the recent high readings of gross beta in some of the pumping wells in the St. Charles County Well Fields, I will sample two wells per month for gross alpha and gross beta, total uranium and nitroaromatics. So far all of the high readings have proved to be false, but as an extra precaution this will be done.

IV. MISCELLANEOUS

Appended is the St. Charles County Monthly Water Sales Report for April 1996.

RE: ATAS #15550.01
Weldon Spring

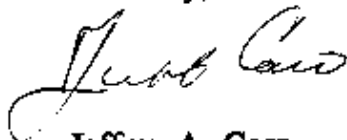

Dear Mr. Remington:

Enclosed is the analytical report for the sample received in our laboratory on April 26, 1996.

If, in your review, you should have any questions or require additional information, please call.

Thank you for choosing ATAS for your analytical needs.

Sincerely,

Jeffrey A. Carr
Project Manager

DISTRIBUTION:

QUARTERLY ENVIRONMENTAL DATA SUMMARY FOR FIRST QUARTER 1996

In support of the Weldon Spring Site Remedial Action Project (WSSRAP) Federal Facilities Agreement (FFA), enclosed is a copy of the Quarterly Environmental Data Summary (QEDS) for the First Quarter of 1996.

The data presented in this letter and attachments, comprise the QEDS. In addition to data generated by Environmental Monitoring Plan sampling, data generated by groundwater operable unit remedial investigation characterization sampling is included in the groundwater and springs tables. Also included in the surface water section are data results that support the ecological risk assessment for the Groundwater Operable Unit and the Engineering Evaluation/Cost Assessment for the Southeast Drainage. These data were received from the contract laboratories, verified by the Weldon Spring site Verification Group and, with the exception of air monitoring data, merged into the database during the First Quarter of 1996. Air monitoring data presented are the most recent complete sets of quarterly data. Air data are not stored in the database.

Significant data, defined as data values that have exceeded defined "above normal" values, are discussed in this letter for Environmental Monitoring Protection (EMP) generated data only. Data collected under Groundwater Operable Unit sampling were not evaluated in accordance with above normal procedures. In ES&H procedures above normal values are based on historic high values, DOE Derived Concentration Guides (DCGs), NPDES limits and other guidelines. The procedures also establish actions to be taken in the event that "above normal" data occur.

All data received and verified during the first quarter were within a permissible range of variability, with the exception of those detailed below. Above normal occurrences are cited for spring and groundwater data. There were none for air, NPDES, or surface water. The following discussion offers a brief summary of the data that met the above-normal criteria merged during the first quarter, and updates on past reported above normal data. The enclosed tables present all the data merged into the data base during the First Quarter 1996 for groundwater, NPDES, surface water, springs and the most recent air data.

NPDES

There were no above normal values for water discharged through NPDES outfalls; however, original uranium analyses for samples collected at Outfalls NP-0003 and NP-0010 on December 19, 1996, were abnormally high. Based on on-site KPA analytical results PMC personnel suspected that there was a dilution factor error. A re-analysis was conducted and the results were in line with the on-site results. The laboratory also stated that the original results were in error.

There are also several cyanide results for the site water treatment plant that are above the permit limit of 0.0075 mg/l. The water was not discharged until it was treated in the effluent ponds and re-analyzed to show compliance. The sample that showed compliance was NP-ES14-010996.

The analytical results for the NPDES outfalls are reported in the quarterly discharge monitoring report as well as in this report.

GROUNDWATER

Weldon Spring Chemical Plant Site

Site Water Treatment Plant

* Sample Number GW-2038-Q495

This Fourth Quarter 1995 sample was reported fluoride (2.11 mg/l), selenium (20.0 ug/l) and selenium and silver are above baselines (15.6 this location. Subsequent data will be careful in these values is detected, an investigation initiated.

* Sample Number GW-2039-Q495

The third quarter groundwater sample (GW-2039-Q395) from this location was reported as having, for the first time, detectable nitroaromatic compounds. This Fourth Quarter 1995 sample is reported as having no detectable nitroaromatics. These latest analyses support the previously-reported likelihood of sample container switching with sample GW-2006-Q395, which historically has nitroaromatic detections. New highs for sulfate (61 mg/l) and chloride (52 mg/l) were reported for this fourth quarter sample. The sulfate value is above baseline (38.9 mg/l) but below the drinking water standard (250 mg/l). Subsequent data will be reviewed to determine if the sulfate concentrations continue to rise and if an investigation is warranted.

* Sample Number GW-2040-Q495

This Fourth Quarter 1995 sample had new high concentrations for the metals barium (881 ug/l), chromium (24.6 ug/l) and lead (8.68 ug/l). The values are all above baselines but below drinking water quality standards. If subsequent sample values for these parameters are greater than or equal to those in this sample, they will be reported as above-normal and the values will be compared to equalization basin leachate sample analyses.

Chemical Plant Vicinity

No elevated or new high values of contaminants in groundwater samples from the chemical plant (with exception to those at the water treatment plant, as reported above) were reported for this quarter.

Weldon Spring Quarry Site

Quarry Water Treatment Plant

* Sample Numbers GW-1035-Q395 and GW-1035-Q495

The Q395 sample was reported in the previous QEDS as having levels of chromium, lead, and chloride above baselines (4.81 ug/l, 2.1 ug/l, and 14.9 mg/l, respectively). The Q495 data (Cr = 21.9 ug/l, Pb = 2.1 ug/l, and chloride = 14.9 mg/l) indicate these levels are still above baseline values. This location is hydraulically upgradient from any quarry operational impacts.

The elevated chloride value is likely due to increased use of road salt along Missouri State Route 94 (to which location MW-1035 is immediately adjacent and downgradient), and the metals values may be the result of leaching from the stainless steel well screen, which is being subjected to corrosive conditions during high chloride level events. Subsequent data will be carefully reviewed and any further excursions will be investigated.

* Sample Number GW-1036-Q495

A new high value for lead was reported for this Fourth Quarter 1995 sample. The 3.0 ug/l value was above baseline (2.06 ug/l), but it was below water quality standards and not statistically significant. Subsequent sample data will be carefully reviewed.

* Sample Numbers GW-1037-Q395 and GW-1037-Q495

The Q395 sample from this location was reported as having chromium (27.3 ug/l) above baseline (<3.0 ug/l). The value for Q495 (8.4 ug/l) remains above baseline, but is significantly lower than the previous quarter. The trending of this value will be monitored in subsequent samples from this location.

* Sample Numbers GW-1040-Q495

The chloride concentration was a new high (13.1 mg/l) and above baseline (10.9 mg/l) for this location. The elevated value may be due to de-icing agents used in winter months or HCl used in the quarry decontamination area during remedial action efforts. Subsequent data will be reviewed and compared with equalization basin leachate analyses in order to isolate the source of the high value.

Quarry Vicinity

* Sample Numbers GW-1005-Q495

Further evaluation of elevated sulfate values reported in previous summaries has not been possible because this monitoring well is still dry. Subsequent sample values will be evaluated when available.

- * Sample Numbers GW-1006-110395 and GW-1008-B695

Lead concentrations for GW-1006-110395 (6.4 ug/l) and GW-1008-B695 (3.5 ug/l) were new high values but not statistically significant (mean + 2 standard deviations). If a consecutive new high value is reported in subsequent samples the lead concentrations will be considered above-normal.

- * Sample Number GW-1031-B196

New high values for uranium (140 pCi/l) and sulfate (100 mg/l), though not statistically significant, were reported for this location north of the Femme Osage Slough. If subsequent new highs consecutively occur for these parameters, the situation will be considered for investigation.

St. Charles County Well Field

- * Sample Number GW-RMW2-Q495

A new high (90.1 ug/l) was reported for arsenic. This value is above drinking water standards (50 ug/l) and data validation has been requested. Subsequent data will be reviewed and reported as above-normal if two consecutive highs occur.

- * Sample Numbers GW-RAWW-Q495 and GW-RAWW-Q495-Re-analysis

The Q495 sample for this sample of influent to the St. Charles County Public Water Supply Treatment facility was reported in the previous QED as having a significantly elevated gross beta value. This value was believed to be an error, because none of the samples from water production wells contributing to the influent were elevated in gross beta. The sample was re-analyzed and the value was reported as 5.8 pCi/l, which is in the normal range for gross beta at this location.

SPRINGS

- * Sample Number SP-6301-081495

A new high (0.42 ug/l) for 2,4,6-Trinitrotoluene (TNT) was reported for the Burgermeister Spring in August 1995. The sample was collected under base-flow conditions and the new high value is statistically insignificant.

MONTHLY REPORT

JUNE 1996

BY

Stanley M. Remington
Consulting Hydrologist

I. CHEMICAL ANALYSES

Two sets of sample results were received during June 1996 from sampling done during May 1996. These were from pumping wells PW-9 and PW-2 and the other set from the treated water from the Chemical Plant site of the Department of Energy. The results from both PW-9 and PW-2 showed that all of the chemical parameters were well within historical ranges and were all below the NPDES limits. The treated water from the Chemical Plant site also was well below the NPDES limits. The results are all appended.

The second quarter sampling was completed by me with the Department of Energy on June 24, 1996. I sampled wells RMW-2 and PW-9. These results have not yet been received. Also the treated water from the Chemical Plant site was sampled on June 28, 1996. These results have not yet been received.

II. FUTURE PLANS

I will sample wells PW-3 and PW-4 during the latter part of July 1996. I also will attend the 24th Annual Missouri Waste Management Conference being held July 21 - 23, 1996 in Columbia, Missouri.

III. MISCELLANEOUS

Appended is the St. Charles County Monthly Water Sales and Inventory of Chemicals - Lime - for the month of May 1996.

RE: ATAS #15815.01-#15815.02
Weldon Spring

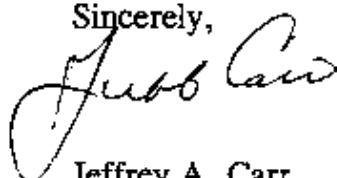

Dear Mr. Remington:

Enclosed are the analytical reports for the samples received in our laboratory on May 24, 1996.

If, in your review, you should have any questions or require additional information, please call.

Thank you for choosing ATAS for your analytical needs.

Sincerely,

Jeffrey A. Carr
Project Manager
